

Are you looking to lower your SCC?

ClusterCleanse

The DairyMaster ClusterCleanse rinses each cluster after each cow is milked. This results in a more hygienic cluster for the next cow cutting down on the risk of infections and helping lower your cell count.

The ultimate in hygienic cleaning technology for your clusters...

Dairymaster **ClusterCleanse**

As farms are getting larger the Dairymaster ClusterCleanse is an immense aid for improving milking hygiene and is of great assistance to farmers fighting the battle against the spread of contagious mastitis during milking such as Staph Aureus, Strep. Ag. or Mycoplasma.

ClusterCleanse is available for all types of parlour in manual or automatic options.

1. Manual Option

With the stand alone version the operator activates the ClusterCleanse manually.

2. Automatic Option

Works seamlessly with Dairymaster:

- Automatic Cluster Removers (ACR's)
- Weighall Milk Meters
- Swiftflo Indicators
- Swiftflo Commanders

When used in conjunction with the above, the system intelligently links with and automatically engages once the automatic cluster remover has removed the cluster from the cow.

The Ultimate Cleaning Process

The cluster and the long milk tube are flushed using a combination of water and air. After the cluster is flushed out it is then automatically purged maximising the cleaning effect. This reduces the risk of cow-to-cow cross infection and contagious mastitis. Lower SCC means higher milk quality payments and better herd health.

Normally when a cow that is infected with Staph Aureus bacteria is milked, these bacteria remain in the liner in large quantities and can be spread to subsequent cows. Usually this is controlled by segregating cows with an infection and milking them last. The Dairymaster ClusterCleanse may eliminate this requirement.

With the Dairymaster ClusterCleanse there is no need to replace existing milking clusters or purchase any special liners and it does not effect the milking vacuum level. The Dairymaster ClusterCleanse can also help reduce the spread of Strep. Ag. and Mycoplasma Mastitis.
